

COMMITTED TO THINKING BEYOND GREEN

*The Mainstream GreenHome™
Raleigh, North Carolina*

Keeping the GreenHome™ Mold Free.

Mold Solutions is proud to be selected as the antimicrobial solution in the Mainstream GreenHome project. The Mainstream GreenHome is the house you've been hearing about for years. It uses less energy, less water; it's healthier to live in and has less impact on the planet. And no, it doesn't look like a spaceship. This ambitious project is the passionate undertaking of Cherokee Investment Partners – a world leader in *brownfield* redevelopment. Their intent is to show that green building practices don't just belong to some Utopian future – they belong in every town and on every block.

Antimicrobial protection is a critical component of green building and a healthy home. But not all antimicrobials are created equal – or green. All of our products are EPA registered, water-based, non-leaching and non-VOC emitting; no less important – they work, guaranteed. Those are claims no other antimicrobial solution can make.

GREEN PRODUCTS ARE BETTER PRODUCTS

Better air quality is a critical component to a sustainable and healthy life style. The presence of mold can be more than a little nuisance—it can prove to be hazardous. The problem is, up until now, many of the solutions used to combat mold and other microbials were themselves a hazard. By emitting dangerous VOC's and leaching toxic compounds many traditional cures were little better than the affliction.

Mold Solutions is committed to a better, greener solution.

When you make a choice to use Mold Solutions, you're making a better choice. Our products are a recognized component of the LEED green building rating system developed by the United States Green Building Council (USGBC).

Our products are water-based.

DuraBan's water-base means the only off-gas released upon surface bonding is H₂O - no toxic gases, no VOCs, no heavy metals, no formaldehyde or phenol groups - just H₂O. This translates into a safe and clean, green mode of action.

Our products are non-leaching.

Unlike conventional antimicrobials that can leach toxic active ingredients into the surrounding environment, DuraBan does not leach or dissipate, its active ingredient has the EPA's lowest toxicity rating. Once bonded to the surface, DuraBan is there to stay. In addition, because DuraBan has a benign mode of action and does not actively leach or poison microbes for its mode of action, there is no risk of adaptive microorganisms or "superbugs." In laboratory testing the DuraBan antimicrobial has never been shown to allow or cause microbial adaptation, resistance or mutation.

If your project is seeking the highest potential LEED score, consider contacting Mold Solutions, the standard in antimicrobial protection.
